

NEW NATIONAL ADVERTISING — PRODUCT PDF IMPORT PROMPT

IMPORTANT: I am attaching a large PDF of approximately 105 MB containing product images and product information. Carefully inspect the entire PDF, extract and analyze the product images/content, and use the information to populate the website's **Products section only**.

1. Inspect the complete PDF

Process the entire attached PDF, not just a sample. Inspect every page and identify every clearly identifiable product, product variant, material, printing service/product, signage product, stationery item, promotional item, or other sellable item shown.

2. Extract and analyze product images

Extract the relevant product images at the best practical quality. Read visible text in the PDF and associate each image with the correct product name and category. Do not invent product names when the PDF provides a clear name.

3. PRODUCTS SECTION ONLY

Do NOT add these images or products to Projects / Our Work. They must be created or updated inside the website's **Products** section. Projects must remain for actual completed work/project examples.

4. Add the catalog line by line

Create or update products individually. For each identifiable product, use the existing product schema and populate the product name, category, subcategory/type when clear, product image, and supported description/metadata when available.

5. Existing products and broken images

The website already contains some products, but some existing product images are not loading. Do not blindly delete the existing catalog. Inspect existing records, match them against the PDF, and repair/reconnect their persistent images where appropriate. Add genuinely new products as new records.

6. Use the real production storage/database

Do not use local file paths, temporary URLs, blob/object URLs, browser-only state, hardcoded image arrays, or temporary preview data. Upload images through the existing production storage flow, preferably Firebase Storage if that is the current architecture, and save persistent image URLs/references in the production Firestore/database records.

7. Preserve the current design

Do not redesign the Products section. Keep the existing product cards, layout, typography, spacing, categories/filters, responsive behavior, navigation, and branding. Only make changes required to correctly import and display the products.

8. Admin Panel compatibility

Every imported product must use the same production data model used by the Admin Panel. I must be able to edit product names, categories, descriptions, images, stock/status fields, and other supported fields from the Admin Panel later. Do not create a separate hidden catalog.

9. Avoid unnecessary duplicates

Before creating a product, compare it with existing production records. If the same product already exists, update/fix that record instead of creating a duplicate. Create a new record only when it is genuinely new.

10. Do not create fake products

Ignore decorative graphics, logos, banners, repeated pages, unrelated photographs, and other non-product assets. Only create products that are clearly supported by the PDF or the existing catalog.

11. Verify the actual website

After importing, open the deployed Products section and verify that the products appear individually and that their images actually render. A database URL alone is not sufficient proof that the image works.

12. Required end-to-end Admin Panel test

Open the production Admin Panel, locate an imported product, edit a supported field, save it, refresh the Admin Panel, and verify the change persists. Then refresh the live Products section and verify the same change appears there. Confirm the product image remains connected after refresh.

13. Restrictions

Do not put these PDF images in Projects. Do not replace unrelated website images. Do not change branding unnecessarily. Do not use placeholder images. Do not invent unsupported products. Do not use temporary/local-only product data.

14. Final acceptance condition

The task is complete only when the useful product catalog from the entire attached PDF has been imported into the **Products section**, relevant images are stored persistently and load correctly, existing broken product images have been repaired where possible, duplicates have been avoided, and all imported records remain editable through the production Admin Panel.

DO NOT JUST SUMMARIZE THE PDF. Actually implement the product import, persistent image upload, database records, and production verification. I will make any later corrections or changes from the Admin Panel.
